Bilateral Meetings

- Wednesday 17:00 - 19:30

Description

Saint Di is a software company founded 4 years ago. Since its inception, the company has been providing outsourcing/nearshoring services (software development for clients based on their requests or providing software as a service, which implies that Saint Di team becomes a part of the client's development team). That way, clients get quality programming services at a lower cost and they are not obliged to extend the contract after the termination. Due to effective communication, we quickly become a part of the team and together with the client, we strive toward their goal. The focus is on web and mobile solutions. The company uses the following technologies: Java, python, c# or .net, html/html5, css/css3, javaScript and JS frameworks (Angular.js, React.js). This year, the company has begun to develop its own product - a startup within the company named OrderEngine. OrderEngine is a B2B solution that makes ordering from suppliers more convenient for owners and managers of cafes, restaurants and other catering facilities. Links:
